#### Abstract

Enantiomerically pure bicyclic proline derivative was prepared by cis-selective allylation and diastereospecific intramolecular alkylation starting from D-pipecolinic acid. In addition, enantiomerically pure azabicyclo N -oxyls derived from the bicyclic proline worked well as catalyst for enantioselective electrooxidation of racemic sec-alcohols to afford optically active sec-alcohols in moderate optical purity.

## 1. Introduction

In the recent past, importance of quaternary $\alpha$-amino acids and their peptides have continued to increase in the fields of medicinal chemistry, and protein engineering. ${ }^{1}$ Since quaternary $\alpha$-amino acids are non-proteinogenic, their synthesis has attracted considerable attention. ${ }^{2}$ Among them, bicyclic proline analogues $\mathbf{A}$ bridged at the $2^{\text {nd }}$ and $5^{\text {th }}$ carbons of the pyrrolidine ring have unique biological ${ }^{3}$ and conformational ${ }^{4}$ properties. Therefore, several synthetic methods for their preparation have been developed (Figure 1). ${ }^{5}$ However, to the best of our knowledge, synthesis of enantiomerically enriched bicyclic proline A1 with an 8-azabicyclo[3.2.1]octane skeleton has not been accomplished to date. ${ }^{6}$ We wish herein to report a convenient method for synthesis of $\mathbf{A 1}^{7}$ starting from D-pipecolinic acid. In addition, chiral $N$-oxyls derived from A1 were prepared and used for enantioselective electrooxidation of DL-1-phenylethanol. ${ }^{8}$

## 2. Results and discussion

### 2.1. Synthesis of bicyclic proline derivative $\mathbf{6}$

Our strategy for synthesis of bicyclic proline derivative $\mathbf{6}$ is shown in scheme 1 , which consists of cis-selective allylation and diastereospecific intramolecular alkylation. To start with, electrochemical methoxylation ${ }^{9}$ of D-pipecolinic acid derivative $\mathbf{1}$ afforded 6-methoxypipecolinate 2 , which was allylated with allyltrimethylsilane catalyzed by $\mathrm{BF}_{3}-\mathrm{OEt}_{2}$ to give diastereomerically enriched 6-allylated pipecolinate cis-3. ${ }^{10}$ After isolation of cis-3 by chromatography, transformation of the 6-allyl group to tosyloxyethyl group was carried out by ozonolysis, then $\mathrm{NaBH}_{4}$ reduction followed by tosylation to obtain 5 in sufficient high yield. Finally, compound 5 underwent a base catalyzed intramolecular alkylation ${ }^{5 d, 11}$ to afford enantiomerically pure 6 with an 8 -azabicyclo[3.2.1]octane skeleton in high yield. Further alkaline hydrolysis of $\mathbf{6}$ gave $N$-protected bicyclic proline 7 in quantitative yield.

## Scheme 1.

The stereoconfiguration of $\mathbf{6}$ was determined by X-ray crystallographic analysis after derivatization of 7 to heterotripeptide 8. ${ }^{12}$ The transformation was carried out in solution-phase method, employing 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (EDC) and 1-hydroxybenzotriazole (HOBt) as coupling reagents (Eq. 1). As shown in Figure 2, bicyclic proline analogue has the conformational property similar
to that of proline, which is $\beta$-turn inducer. ${ }^{13}$

### 2.2. Synthesis of enantiomerically pure $N$-oxyls 10, 13, and 16a-d

Enantiomerically pure azabicyclo- $N$-oxyl 10 possessing methoxycarbonyl group at the bridgehead position was synthesized from 6 by deprotection of $N$-methoxycarbonyl group utilizing $\mathrm{Me}_{3} \mathrm{SiI}$ followed by m-CPBA oxidation (Eq. 2). $N$-Oxyl 13 was synthesized as follows: reduction of methyl ester group followed by benzoylation of hydroxyl group gave compound 11 in moderate yield. After deprotection of 11, successive oxidation with $m$ CPBA afforded $N$-oxyl 13 (Eq. 3).

Compounds 14a-d substituted with several amide groups were prepared by using solution-phase method (Eq. 4). $N$-Oxyls 16a-d were prepared in a similar method similar to that described for the preparation of $N$-oxyl 10. The results are summarized in Table 1.

Cyclic voltammogram for $\mathbf{1 0}$ showed reversible wave pattern similar to that of TEMPO. ${ }^{14}$ This fact strongly suggests that enantiomerically pure azabicyclo- N -oxyls could also play the role of an oxidation mediator just like TEMPO (Figure 3).

2.3. Enantioselective electrooxidation of DL-1-phenylethanol mediated by chiral azabicyclo-N-oxyls 10, 13, and 16a-d
The enantioselective electrooxidation of DL-1-phenylethanol (17) ${ }^{8,15}$ mediated by chiral azabicyclo- $N$-oxyls 10, 13, and 16a-d was carried out in an undivided beaker-type cell having platinum electrodes as follows (Eq. 5). That is, oxidation was conducted, containing a catalytic amount of $N$-oxyl, excess amount of sodium bromide, and a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and saturated aqueous $\mathrm{NaHCO}_{3}$ as solvent. After passing through 1.5 $F / \mathrm{mol}$ of electricity at constant current ( 20 mA , terminal voltage: ca 3 V ) at $0^{\circ} \mathrm{C}$, acetophenone $\mathbf{1 8}$ and (S)-17 were obtained. The results are shown in Table 2. The use of $N$-oxyls $\mathbf{1 0}$ and 16a-d afforded (S)-17 with moderate $s$ value ${ }^{16}$ (Entries 1, 3, 4—6), while (S)-17 was recovered with low enantioselectivity when $N$-oxyl $\mathbf{1 3}$ was used (Entry 2 ).

Enantioselective oxidation of other sec-alcohols $19-24$ mediated by $\mathbf{1 6 b}$ were examined (Eq. 6). Table 3 summarizes the results. In all cases, (S)-alcohols $\mathbf{1 9}-\mathbf{2 4}$ were recovered with low to moderate $s$ value.

Entry

Scheme 2 shows our proposed mechanism for kinetic resolution of DL-17 mediated by chiral $N$-oxyl 16b. Compound DL- $\mathbf{1 7}$ has prospects to approach 16b' generated by the oxidation of $\mathbf{1 6 b}$ with bromonium ion from path a or path $b$. In the case of path $a$, since $(R) \mathbf{- 1 7}$ can smoothly approach $\mathbf{1 6 b}$ ' to form the active intermediate, $(R)$ - $\mathbf{1 7}$ can easily be oxidized to afford acetophenone (18). On the other hand, the formation of intermediate composed of (S)-17 and 16b seems to be somewhat difficult. Also, in the case of path $b$, the intermediate seems to be somewhat unstable because the distance $\mathrm{O}-\mathrm{H}^{\mathrm{a}} \cdots \mathrm{O}^{\mathrm{a}}=\mathrm{C}$ is slightly longer for a hydrogen bond.

## 3. Conclusion

We have accomplished a convenient method for synthesis of enantiomerically pure bicyclic proline analogues starting from D-pipecolinic acid. It has similar conformational property to that of proline, which is $\beta$-turn inducer. Chiral azabicyclo $N$-oxyls derived from bicyclic amino acid worked well as catalysts in enantioselective electrooxidation of racemic sec-alcohols to afford optically active sec-alcohols in moderate $s$ value.

## 4. Experimental Section

### 4.1. General

Electrochemical reactions were carried out using DC Power Supply (GP 050-2) of Takasago Seisakusho, Inc. ${ }^{1}$ H NMR spectra were measured on a Varian Gemini 300 and 400 spectrometer with TMS as an internal standard. ${ }^{13} \mathrm{C}$ NMR spectra were measured on a Varian Gemini 300 and 400 spectrometer with TMS as an internal standard. IR spectra were obtained on a Shimadzu FTIR-8100A. Mass spectra were obtained on a JEOL JMS-DX 303 instrument.

All reagents and solvents were used as supplied without further purification.
Although we could not determine optical purity for compounds 7, 9, 10, 11, 12, 13, $\mathbf{1 4 a}-\mathbf{d}, \mathbf{1 5 a}-\mathbf{d}$ and $\mathbf{1 6 a}-\mathbf{d}$, it was assumed that there was no racemization during their derivation from enantiomerically pure 6 .

4.4. General procedure for enantioselective electrooxidation of DL-sec-alcohols 17, 19-24 with $N$-oxyls 10, 13, and 16a-d

Anodic oxidation of DL-1-phenylethanol (DL-17) was carried out using platinum electrodes ( $1 \mathrm{~cm} \times 2 \mathrm{~cm}$ ) in an undivided beaker-type cell. DL-17 ( $61 \mathrm{mg}, 0.5 \mathrm{mmol}$ ), $\mathbf{1 0}$ $(9.2 \mathrm{mg}, 0.05 \mathrm{mmol})$ and $\mathrm{NaBr}(206 \mathrm{mg}, 2.0 \mathrm{mmol})$ were added into a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.5 \mathrm{~mL})$ and saturated aqueous $\mathrm{NaHCO}_{3}(2.5 \mathrm{~mL})$. After passing through 1.5 $F / \mathrm{mol}$ of electricity at constant current $(20 \mathrm{~mA})$ at $0^{\circ} \mathrm{C}$, the mixture was poured into water and extracted with AcOEt ( 20 mL x 3 ). The combined organic layer was dried over anhydrous $\mathrm{MgSO}_{4}$ and the solvent was removed under reduced pressure. The residue was purified by silica gel column chromatography ( $n$-hexane : $\mathrm{AcOEt}=10: 1$ ) to afford acetophenone 18 ( $35.4 \mathrm{mg}, 59 \%$ yield) and ( $S$ )-17 ( $24.6 \mathrm{mg}, 41 \%$ yield) as a colorless oil.

The optical purity of $(S)-\mathbf{1 7}$ was determined by chiral HPLC: Daicel Chiralcel OB column ( $4.6 \mathrm{~mm} \phi, 250 \mathrm{~mm}$ ), $n$-hexane : 2-propanol = $15: 1$, wavelength: 254 nm , flow rate: $0.5 \mathrm{~mL} / \mathrm{min}$, retention time: 13.5 min for $(S)-\mathbf{1 7}, 17.5 \mathrm{~min}$ for $(R)-17$.

The optical purity of $(S)-\mathbf{1 9}$ was determined by chiral HPLC: Daicel Chiralcel OB column ( $4.6 \mathrm{~mm} \phi, 250 \mathrm{~mm}$ ), $n$-hexane : 2-propanol = $15: 1$, wavelength: 254 nm , flow rate: $0.5 \mathrm{~mL} / \mathrm{min}$, retention time: 11.9 min for $(S) \mathbf{- 1 9}, 16.9 \mathrm{~min}$ for $(R) \mathbf{- 1 9}$.

The optical purity of (S)-20 was determined by chiral HPLC: Daicel Chiralcel AD column ( $4.6 \mathrm{~mm} \mathrm{\phi}, 250 \mathrm{~mm}$ ), n-hexane : 2-propanol $=100: 1$, wavelength: 254 nm , flow rate: $1.0 \mathrm{~mL} / \mathrm{min}$, retention time: 14.0 min for $(R)-\mathbf{2 0}, 16.5 \mathrm{~min}$ for $(S)-\mathbf{2 0}$.

The optical purity of (S)-21 was determined by chiral HPLC: Daicel Chiralcel OJ column ( $4.6 \mathrm{~mm} \phi, 250 \mathrm{~mm}$ ), $n$-hexane : 2-propanol $=9: 1$, wavelength: 254 nm , flow rate: $1.0 \mathrm{~mL} / \mathrm{min}$, retention time: 13.8 min for $(S)-\mathbf{2 1}, 16.8 \mathrm{~min}$ for $(R)-\mathbf{2 1}$.

The optical purity of (S)-22 was determined by chiral HPLC: Daicel Chiralcel OJ column ( $4.6 \mathrm{~mm} \phi, 250 \mathrm{~mm}$ ), $n$-hexane : 2-propanol $=9: 1$, wavelength: 254 nm , flow rate: $1.0 \mathrm{~mL} / \mathrm{min}$, retention time: 12.7 min for $(S)-\mathbf{2 2}, 16.0 \mathrm{~min}$ for $(R)-\mathbf{2 2}$.

The optical purity of $(S)-23$ was determined by chiral HPLC: Daicel Chiralcel OB column ( $4.6 \mathrm{~mm} \mathrm{\phi}, 250 \mathrm{~mm}$ ), $n$-hexane : 2-propanol $=15: 1$, wavelength: 254 nm , flow rate: $1.0 \mathrm{~mL} / \mathrm{min}$, retention time: 15.0 min for $(R)-\mathbf{2 3}, 27.0 \mathrm{~min}$ for $(S)-\mathbf{2 3}$.

The optical purity of (S)-24 was determined by chiral HPLC: Daicel Chiralcel OD-H column ( $4.6 \mathrm{~mm} \mathrm{\phi}, 250 \mathrm{~mm}$ ), n-hexane : 2-propanol = $50: 1$, wavelength: 254 nm , flow rate: $0.5 \mathrm{~mL} / \mathrm{min}$, retention time: 21.0 min for $(S)-\mathbf{2 4}, 22.5 \mathrm{~min}$ for $(R)-\mathbf{2 4}$.

Cyclic voltammogram for $\mathbf{1 0}$ was measured in $0.1 \mathrm{M} \mathrm{Et}_{4} \mathrm{NBF}_{4} / \mathrm{MeCN}$ solution using glassy-carbon as a working electrode, platinum as a counter electrode, and $\mathrm{Ag} / 0.01 \mathrm{M} \mathrm{AgNO}_{3}$ as a reference electrode. Concentration of $\mathbf{1 0}: 1.0 \mathrm{mM}$. Scan rate: $30 \mathrm{mV} / \mathrm{s}$. Cyclic voltammogram for other $N$-oxyls showed reversible wave pattern similar to that for $\mathbf{1 0}$. Oxidation potential: 0.83 V for $\mathbf{1 0}, 0.82 \mathrm{~V}$ for $\mathbf{1 3}$, 0.58 V for $\mathbf{1 6 a}, 0.79 \mathrm{~V}$ for $\mathbf{1 6 b}, 0.78 \mathrm{~V}$ for $\mathbf{1 6 c}, 0.80 \mathrm{~V}$ for $\mathbf{1 6 d}$.
