#### Abstract

Kinetic resolution of 3-hydroxyalkanamides with good to high selectivities was achieved by benzoylation using copper(II) triflate and $(R, R)-\mathrm{Ph}-\mathrm{BOX}$ as a catalyst, which also mediated enantioselective tosylation of 2,2bis(hydroxymethy)alkanamides with high efficiency.

Key words: Kinetic resolution, 3-Hydroxyalkanamides, Acylations, Chiral copper complex, Molecular recognition

Optically active 3-hydroxyalkanoic acid derivatives are important precursors for preparations of various biologically active compounds. ${ }^{1}$ A variety of enzymatic kinetic resolution methods has been developed for preparation of optically pure 3-hydroxyalkanoic acid derivatives. ${ }^{2}$ To the best of our knowledge, nonenzymatic method has been little known to date. ${ }^{3}$ Recently, we have reported an efficient method for kinetic resolution of 1,2 -diols $\mathbf{1}$. The method is based on recognition of 1 by copper ion associated with chiral ligand $(R, R)-\mathrm{Ph}-\mathrm{BOX}^{4}$ to afford the activated intermediates 2 followed by benzoylation (Scheme 1). ${ }^{5}$

Scheme 1 Asymmetric benzoylation of 1,2-diols 1 based on the recognition by $\mathrm{Cu}(\mathrm{II})-(R, R)-\mathrm{Ph}-\mathrm{BOX}$

We report herein non-enzymatic kinetic resolution of 3hydroxyalkanamides by benzoylation with $\mathrm{Cu}(\mathrm{II})-(R, R)$-Ph-BOX catalyst affording optically active 3-hydroxyalkanamide derivatives in good to high yields and enantioselectivities.

We began our investigation by trying benzoylation of ethyl DL-3-hydroxybutanoate (4) as a model compound to see whether it could be recognized by chiral copper(II) complex or not. We found out the following, in the absence of copper(II) triflate and $(R, R)-\mathrm{Ph}-\mathrm{BOX}$ the reaction of 4 with BzCl did not almost proceed, while in the presence of the catalysts, benzoylated product 5 was obtained in $19 \%$ yield based on 4 . In contrast, DL-3-hydroxy- $N$-phenylbutanamide (6a) was benzoylated more efficiently in the presence of $\mathrm{Cu}(\mathrm{II})-(R, R)-\mathrm{Ph}-$ BOX to afford benzoylated product 7a in $41 \%$ yield (Scheme 2). These results imply that 6a was efficiently recognized by $\mathrm{Cu}(\mathrm{II})-(R, R)-\mathrm{Ph}-\mathrm{BOX}$ complex.

Scheme 2 Benzoylation of ester 4 and amide 6a in the absence or presence of $\mathrm{Cu}(\mathrm{OTf})_{2}$ and $(R, R)-\mathrm{Ph}-\mathrm{BOX}$

Next, we tried competitive reaction between 6a and 2,4pentanediol (8) (syn:anti $\approx 50: 50$ ) with or without $\mathrm{Cu}(\mathrm{II})-(R, R)$ - $\mathrm{Ph}-\mathrm{BOX}$ (Scheme 3). In the presence of $\mathrm{Cu}(\mathrm{II})-(R, R)-\mathrm{Ph}-\mathrm{BOX}$ or $\mathrm{Cu}(\mathrm{II})-$ racemic-Ph-BOX 7a was exclusively formed, whereas in the absence of $\mathrm{Cu}(\mathrm{II})-(R, R)$ - Ph -BOX only monobenzoylated diol 9 (syn:anti $\approx 63: 37$ ) was generated. From these results, we deduced that 6a is preferentially recognized over $\mathbf{8}$ by
the copper catalyst. ${ }^{6}$ Acceleration for benzoylaiton of $\mathbf{6 a}$
$(R, R)$ - (or racemic-) Ph-BOX.
was also observed in the presence of $\mathrm{Cu}(\mathrm{OTf})_{2}$ without

Scheme 3 Competitive reaction between $\mathbf{6 a}$ and $\mathbf{8}$ by benzoylation in the absence or presence of $\mathrm{Cu}(\mathrm{OTf})_{2}$ and $(R, R)$ - (or racemic-) $\mathrm{Ph}-\mathrm{BOX}$

In our quest to get excellent reaction conditions for kinetic resolution of DL-6a, we investigated the effect of bases and solvents on benzoylation. ${ }^{7}$ These results are summarized in Table 1. They show a dependence of yield and $\%$ ee of the product 7 a as well as the reaction time on the solvents and bases used. Use of AcOEt as a solvent and $\mathrm{K}_{2} \mathrm{CO}_{3}$ as a base gave (S)-7a ${ }^{8}$ in $41 \%$ yield and a high enantioselectivity ( $85 \%$ ee) with a selectivity $s$ value ${ }^{10}$ of 27 for 2 h (Entry 1). THF and 1,4-dioxane
gave comparable results to AcOEt (Entries 2 and 3), while $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{Et}_{2} \mathrm{O}$ were less efficient (Entries 4 and 5). Moreover, use of alcohols such as $i \mathrm{PrOH}$ or EtOH gave (S)-7a in high enantioselectivity (Entries 6 and 7). $\mathrm{K}_{2} \mathrm{CO}_{3}$ was the most effective base (Entry 1) among the tested bases (Entries 8-11). Use of 0.05 equiv of $\mathrm{Cu}(\mathrm{OTf})_{2}$ and $(R, R)$ - $\mathrm{Ph}-\mathrm{BOX}$ led to slightly inferior result compared to using 0.1 equiv of chiral $\mathrm{Cu}(\mathrm{II})$ catalyst (Entry 12).

Utilizing the conditions optimized in Table 1, we screened the effect of amide $N$-substituents shown in Table 2. The $s$ value of $N$-4-chlorophenyl amide $\mathbf{6 b}$ was slightly lower than that of 6a (Entry 1), while N-4methylphenyl amide 6c gave high $s$ value of 34 (Entry
2). Benzoylation of $N$-3,5-dimethylphenyl amide $\mathbf{6 d}$ and the corresponding hexafluorinated amide $\mathbf{6 e}$ required longer reaction time, and the $s$ values were moderate for 6d and poor for $\mathbf{6 e}$ (Entries 3 and 4). N-2Methylphenyl amide $\mathbf{6 f}$ was smoothly asymmetrically
benzoylated to afford 7 f with $89 \%$ ee. $N$-Benzyl amide 6 g was inferior to N -phenyl amide 6a (Entry 6). $\mathrm{N}, \mathrm{N}$ -

Disubstituted amides $\mathbf{6 h}, \mathbf{6 i}$ and $\mathbf{6 j}$ also gave slightly lower $s$ values compared to that of $\mathbf{6 a}$ (Entries 7-9).

Table 3 summarizes kinetic resolution of various 3hydroxyalkanamides 6ap-aw by benzoylation under the optimized reaction condition. Compounds 6ap substituted with Et and 6aq with $n \mathrm{Pr}$ group were asymmetrically benzoylated to afford corresponding optically active (S)-7ap ${ }^{11}$ and (S)-7aq ${ }^{11}$ in good yield and moderate enantioselectivity, respectively (Entries 1 and 2). Although compounds 6ar and 6as substituted with $i \operatorname{Pr}$ and $i \mathrm{Bu}$ were kinetically resolved with moderate enan-
tioselectivity, the yield was low (Entries 3 and 4). Benzoylation of cyclohexylated compound 6at did not proceed (Entry 5), while phenylated 6au was benzoylated to afford $(R)-7 \mathbf{a u}^{12}$ in moderate yield and good enantioselectivity (Entry 6). Straight carbon-chained compounds 6av terminally fuctionalized with Br atom and 6aw with $N$-Boc protected amino group gave good $s$ value of 16 and 18, respectively (Entries 7 and 8).

${ }^{\mathrm{a}}$ 6ap-aw $(0.5 \mathrm{mmol}), \mathrm{Cu}(\mathrm{OTf})_{2}(0.05 \mathrm{mmol}),(R, R)-\mathrm{Ph}-\mathrm{BOX}(0.05 \mathrm{mmol}), \mathrm{BzCl}(0.25 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(0.5 \mathrm{mmol})$ in AcOEt $(2 \mathrm{~mL})$ at rt .
${ }^{\mathrm{b}}$ Determined by HPLC.

To increase the scope of our reaction, we tried enantioselective benzoylation and tosylation ${ }^{13}$ of 2,2bis(hydroxymethyl)alkanamides 10a-c. The results are shown in Table 4. Asymmetric benzoylation and tosyla-
tion of 10a-c smoothly proceeded to give the corresponding mono-benzoylated compounds 11a-c ${ }^{14}$ and mono-tosylated compounds 12a-c ${ }^{14}$ with good to high yields and enantioselectivities (Entries 1-6). It is note-
worthy to state that 12a-c were obtained in higher enantiomeric purity than those of 11a-c (Entries 4-6), partially due to an intramolecular acyl transfer ${ }^{15}$ which caused racemization of optically pure benzoylated compound 11c, but did not happen in the case of tosylation. This is illustrated in Scheme 4.

Scheme 4 Racemization of 11c and 12c
In summary, we have accomplished the non-enzymatic kinetic resolution of 3-hydroxyalkanamides by benzoylation and desymmetrization of 2,2-bis(hydroxymethyl)alkanamides by tosylation utilizing chiral copper catalyst. The mechanistic study of these reactions and their synthetic applications ${ }^{16}$ are underway.
