#### Abstract

Enantiomerically pure azabicyclo-N-oxyls were prepared from L-hydroxyproline. They mediated enantioselective electrooxidation of racemic sec-alcohols to afford optically active sec-alcohols with moderate to high s value (up to 21).

2,2,6,6-Tetramethylpiperidine- $N$-oxyl (TEMPO) has been utilized in chemical ${ }^{1}$ and electrochemical oxidation ${ }^{2}$ of alcohols as a mediator. Also, optically active $N$-oxyls structurally modified from TEMPO were effective for oxidative kinetic resolution of sec-alcohols by chemical and electrochemical methods. ${ }^{3}$ We have recently reported preparation of several azabicyclo- $N$-oxyls and their mediatory role for electrooxidation of alcohols. ${ }^{4}$ This oxidation was applicable to a transformation of sterically hindered secondary alcohols into the corresponding ketones in higher yields than those of TEMPO-mediated reactions (Eq. 1). We wish to report herein the preparation of enantiomerically pure azabicyclo- $N$-oxyls and their mediatory role for enantioselective electrooxidation of racemic sec-alcohols. ${ }^{5}$

The chiral azabicyclo skeleton was prepared from L-hydroxyproline as shown in Eq. 2. Namely, the electrooxidation of $N$-methoxycarbonyl-L-hydroxyproline ethyl ester (1) afforded methoxylated compound 2 in $94 \%$ yield, which was allylated with

[^0]allyltrimethylsilane catalyzed by $\mathrm{TiCl}_{4}$ to give allylated compound $\mathbf{3}$ as a diastereomer mixture. Alkaline hydrolysis of $\mathbf{3}$ followed by electrooxidation afforded methoxylated diastereomeric mixture 4 in $70 \%$ yield. $\mathrm{TiCl}_{4}$-catalyzed cyclization ${ }^{6}$ for (2S)-isomer of $\mathbf{4}$ afforded the corresponding azabicyclo compound 5 in enantiomerically pure form, ${ }^{7}$ while (2R)-isomer of $\mathbf{4}$ did not give the corresponding cyclized product but polar components.

Enantiomerically pure azabicyclo- $N$-oxyls $7 \mathbf{7 a}$ and $7 \mathbf{b}-\mathbf{k}$ attached with various O-protecting groups were synthesized by usual methods as shown in Eq. 3. The yields are summarized in Table 1. Acylation for hydroxyl group of $\mathbf{5}$ gave $\mathbf{6 b}-\mathbf{k} .{ }^{8}$ After $N$-methoxycarbonyl group of $\mathbf{5}$ and $\mathbf{6 b}$-k were removed with $\mathrm{Me}_{3} \mathrm{SiI}$, successive oxidation with $m$ CPBA afforded $N$-oxyls 7a-k. ${ }^{9}$

Table 1. Preparation of enantiomerically pure N -oxyls $7 \mathrm{a}-\mathrm{k}$

| Entry | PG | Yield of $\mathbf{6 b - k}$ (\%) |  | Yield of $\mathbf{7 a - k}(\%)$ |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
| 1 | H |  | - | $\mathbf{7 a}$ | 35 |
| 2 | Acetyl | $\mathbf{6 b}$ | 88 | $\mathbf{7 b}$ | 65 |
| 3 | Pivaloyl | $\mathbf{6 c}$ | 49 | $\mathbf{7 c}$ | 50 |
| 4 | Benzoyl | $\mathbf{6 d}$ | 96 | $\mathbf{7 d}$ | 59 |
| 5 | 3,5-Dimethylbenzoyl | $\mathbf{6} \mathbf{e}$ | 54 | $\mathbf{7 e}$ | 47 |
| 6 | 2-Phenylbenzoyl | $\mathbf{6 f}$ | 70 | $\mathbf{7 f}$ | 30 |
| 7 | 1-Naphthoyl | $\mathbf{6 g}$ | 67 | $\mathbf{7 g}$ | 57 |
| 8 | 1-(2-Methylnaphthoyl) | $\mathbf{6 h}$ | 31 | $\mathbf{7 h}$ | 37 |
| 9 | 2-Naphthoyl | $\mathbf{6 i}$ | 75 | $\mathbf{7 i}$ | 70 |
| 10 | Tosyl | $\mathbf{6 j}$ | $\mathbf{7 3}$ | $\mathbf{7 j}$ | 48 |
| 11 | Phenylcarbamoyl | $\mathbf{6 k}$ | 66 | $\mathbf{7 k}$ | 57 |

Cyclic voltammogram for $\mathbf{7 g}$ showed reversible wave pattern similar to that for azabicyclo- $N$-oxyl $\mathbf{A}^{4,10}$ This strongly suggests that enantiomerically pure azabicyclo- $N$-oxyls could also play the role of an oxidation mediator just like $\mathbf{A}$ (Fig. 1).

Figure 1. Cyclic voltammogram for $\mathbf{7 g}$.

The enantioselective electrooxidation of DL-1-phenylethanol (8) catalyzed with chiral azabicyclo- $N$-oxyls $7 \mathbf{a}-\mathbf{m}$ was carried out as follows (Eq. 4). ${ }^{11}$ That is, the oxidation was conducted using platinum electrodes in an undivided beaker-type cell, containing a catalytic amount of $\mathbf{7 a}-\mathbf{m}$, excess amount of sodium bromide, and a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and saturated aqueous $\mathrm{NaHCO}_{3}$ as solvent. After passing through $1.5 \mathrm{~F} / \mathrm{mol}$ of electricity at constant current ( 20 mA , terminal voltage: ca 3 V ) at $0^{\circ} \mathrm{C}$, acetophenone 9
and (S)-8 were obtained. The results are shown in Table 2. 0.1 equiv of $N$-oxyl 7a did not work as a mediator for oxidation at all (entry 1 ). ${ }^{13}$ In the case of using acetylated $N$-oxyl 7b, pivaloylated 7c, 3,5-dimethylbenzoylated 7e, and 2-phenylbenzoylated 7f, (S)-8 was recovered with low $s$ value (entries $2,3,5$ and 6 ), ${ }^{14}$ while use of benzoylated $\mathbf{7 d}$ afforded (S)-8 with moderate $s$ value of 8 (entry 4). The most efficient $N$-oxyl $\mathbf{7 g}$ which was protected with 1-naphthoyl group gave (S)-8 with high $s$ value of 21 (entry 7). Other $N$-oxyls $\mathbf{7 h} \mathbf{- m}$ were less effective than $\mathbf{7 g}$ (entries 11-16). ${ }^{15,16}$ Although 0.2 or 0.5 equiv of $N$-oxyl 7 g worked well as a chiral mediator for the enantioselective oxidation, 0.05 equiv of $\mathbf{7 g}$ was somewhat ineffective for enantioselectivity (entries $8-10$ ).

Table 3 summarizes the enantioselective oxidation of some sec-alcohols $\mathbf{1 0} \mathbf{- 1 4}$ mediated by $7 \mathbf{g}$, which was passed through $1.5 \mathrm{~F} / \mathrm{mol}$ of electricity at constant current ( 20 mA , terminal voltage: ca 3 V ) at $0^{\circ} \mathrm{C}$ (Eq. 5). (S)-1-(2-Methylphenyl)ethanol ((S)-10) and (S)-1-(2,4,6-trimethylphenyl)ethanol ((S)-11) were obtained in $47 \%$ yield with $72 \%$ ee for (S)-10 (entry 1) and in $\mathbf{4 7 \%}$ yield with $64 \%$ ee for ( $S$ )-11 (entry 2 ). Although in the case of 1-(1-naphthalenyl)ethanol (12) and 1-indanol (14), (S)-12 and (S)-14 were obtained with low $s$ value of 6 and 5, respectively (entries 3 and 5), 1-(2-naphthalenyl)ethanol (13) gave (S)-13 with good $s$ value of 11 (entry 4).

Table 3 Enantioselective oxidation of various sec-alcohols $\mathbf{1 0 - 1 4}$ catalyzed by $\mathbf{7 g}$
Entry

Scheme 1 shows our proposed mechanism for kinetic resolution of DL-8 mediated by chiral $N$-oxyl $7 \mathbf{g}$. The carbonyl group of $N$-oxoammonium ion $7 \mathbf{g}$, which is generated
by the oxidation of $7 \mathbf{g}$ with bromonium ion, might coordinate to the oxoammonium group. Since ( $R$ )-8 can smoothly approach $\mathbf{7 g}$ ' to form the active intermediate, $(R)-\mathbf{8}$ might be easily oxidized to afford acetophenone (9). On the other hand, the formation of intermediate composed of (S)-8 and $\mathbf{7} \mathbf{g}$ ' seems to be somewhat difficult.

In summary, we report preparation of enantiomerically pure azabicyclo- $N$-oxyls and their mediatory role for enantioselective electrooxidation of racemic sec-alcohols. $O$-Protecting group on azabicyclo- N -oxyls affected the enantioselectivity for the oxidation of sec-alcohols. Further modification of chiral $N$-oxyls is underway.

6. Physical data for 5: Colorless oil. $[\alpha]^{24}{ }_{\mathrm{D}}=+5.6$ (c 1.0, $\mathrm{CHCl}_{3}$ ). IR (neat): 3480, $2955,1705 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.42(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 4.25(\mathrm{~d}, \mathrm{~J}=6.4 \mathrm{~Hz}$, 1 H ), 4.11 (br s, 1H), 4.11-3.98 (m, 1H), 3.74 (s, 3H), 2.80-2.50 (br s, 1H), 2.21-1.80 (m, 6H). [HR-FAB(+)]: m/z calcd for $\mathrm{C}_{9} \mathrm{H}_{15} \mathrm{ClNO}_{3}[\mathrm{M}+\mathrm{H}]^{+}$220.0740: found 220.0735 .
7. The optical purity of $\mathbf{5}$ was determined after conversion to 1 -naphthoylaed $N$-oxyl 7 g by chiral HPLC: Daicel Chiralcel OD-H column ( $4.6 \mathrm{~mm} \phi, 250 \mathrm{~mm}$ ), $n$-hexane : isopropanol $=5: 1$, wavelength: 254 nm , flow rate: $1.0 \mathrm{~mL} / \mathrm{min}$, retention time: 12.3 min for ( $6 R$ )-7g, 17.4 min for ( $6 S$ )- $\mathbf{7 g}$.
8. The stereoconfiguration for $\mathbf{6 g}$ was deduced by NOE correlation.

9. Physical data for 7g: Red amorphous. $[\alpha]_{\mathrm{D}}{ }^{27}=-13.3$ (c 1.0, $\mathrm{CHCl}_{3}$ ). IR (neat): 2930, $1717 \mathrm{~cm}^{-1}$. [HR-EI]: $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{18} \mathrm{H}_{17} \mathrm{ClNO}_{3}[\mathrm{M}]^{+} 330.0897$ : found 330.0899.
10. Cyclic voltammogram for $7 \mathbf{g}$ was measured in $0.1 \mathrm{M} \mathrm{Et}_{4} \mathrm{NBF}_{4} / \mathrm{MeCN}$ solution using glassy-carbon as a working electrode, platinum as a counter electrode, and $\mathrm{Ag} / 0.01$ $\mathrm{M} \mathrm{AgNO}_{3}$ as a reference electrode. Concentration of $7 \mathrm{~g}: 1.0 \mathrm{mM}$. Scan rate: 30 $\mathrm{mV} / \mathrm{s}$. Cyclic voltammogram for other O -acyloxylated N -oxyls $\mathbf{7 b}-\mathbf{f}, \mathbf{h}-\mathrm{m}$ showed reversible wave pattern similar to that for $\mathbf{7 g}$, while that for hydroxylated $N$-oxyls $7 \mathbf{7}$ was irreversible.
11. Representative procedure for the enantioselective electrooxidation of sec-alcohols: Anodic oxidation of DL-1-phenylethanol (DL-8) was carried out using platinum electrodes ( $1 \mathrm{~cm} \times 2 \mathrm{~cm}$ ) in an undivided beaker-type cell. DL-8 ( $61 \mathrm{mg}, 0.5 \mathrm{mmol}$ ), $7 \mathbf{g}(16.5 \mathrm{mg}, 0.05 \mathrm{mmol})$ and $\mathrm{NaBr}(206 \mathrm{mg}, 2.0 \mathrm{mmol})$ were added into a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.5 \mathrm{~mL})$ and saturated aqueous $\mathrm{NaHCO}_{3}(2.5 \mathrm{~mL})$. After passing through 1.5 $\mathrm{F} / \mathrm{mol}$ of electricity at constant current $(20 \mathrm{~mA})$ at $0^{\circ} \mathrm{C}$, the mixture was poured in water and extracted with AcOEt ( 20 mL x 3 ). The combined organic layer was dried over $\mathrm{MgSO}_{4}$ and the solvent removed under reduced pressure. The residue was purified by silica gel column chromatography ( $n$-hexane : AcOEt = $10: 1$ ) to afford acetophenone $9(25.8 \mathrm{mg}, 43 \%$ yield) and (S)-8 ( $34.2 \mathrm{mg}, 56 \%$ yield) as a colorless oil. ${ }^{12}$
12. The optical purity of (S)-8 was determined by chiral HPLC: Daicel Chiralcel OB column ( $4.6 \mathrm{~mm} \mathrm{\phi}, 250 \mathrm{~mm}$ ), $n$-hexane : isopropanol = $15: 1$, wavelength: 254 nm , flow rate: $0.5 \mathrm{~mL} / \mathrm{min}$, retention time: 13.5 min for ( $(S) \mathbf{8}, 17.5 \mathrm{~min}$ for $(R)-\mathbf{8}$.
13. DL-8 was oxidized in the absence of $N$-oxyl to afford $\mathbf{9}$ with $16 \%$ yield.
